through it. You have noticed that lightning hits the biggest tree and the tallest building. In the North hemisphere the South pole magnets are going up, and the North pole magnets coming down in the same flash. Lightning only strikes if the North and South magnets are concentrated too much in a small space. If not concentrated then they pass through everything without much notice. I believe that water, sunlight and North and South pole magnets are making the plants to grow.

You have heard that if somebody happens to hold a power line in their bare hands it becomes impossible for him to let loose from the power line. The power line is full of North and South pole magnets, so they overpower the body's weaker system, and make it impossible for it to open the hands. This shows that the magnets can contract and release the muscles.

I can see tiny lightning in my eyes if I close the eye lids and give a side push to the eye ball from the nose outward, but I cannot do it every day. When I keep eating more for some time then I can see the tiny lightning while my eyes are open. All that I have to do is to turn my head from one side to the other side. This shows that we have in our body the same kind of magnets that are making the big lightning in the sky. When I connect my tongue and feet with micro-ampere meter, the meter shows that I have magnets in my body. Some times I have more of the magnets in my body than at other times. The presence of magnets in our body would indicate that the magnets are operating our muscles.

Where do our bodies get the magnets from? You know that to get the magnets from zinc we have to put the zinc in acid in the battery where it can be dissolved. Our digestive system is like a battery but more complicated. We get magnets from the food we eat. The acid and other digestive juices dissolve the food and liberate the magnets to be used for other purposes.

I have never studied human anatomy, but I know there are many little cords that the magnets can pass through. All that has to be done is to make the right connections. All our body functions are physical, there is no mental function in us, for instance thinking the same as talking is physical process. We all would think loud if we were not suppressed while we were small. When we think we contract the muscles that are for that purpose, but the contraction is so delicate we cannot notice it. This is all that I can tell about our body functions. If I had studied chemistry and human anatomy I am sure I could tell you more about our body functions.
